

Endurance Karting ALFANO Laptimer Manual

The Endurance Karting Alfano lap timer is very helpful and fun to have mounted on the steering wheel of the kart. It will display your lap time as soon as it has been completed and it will keep displaying it till the next lap has been completed. It will also display the fastest lap time in another field and show you the difference between the fastest lap time and your current lap time.

The unit is very helpful in experimenting with different racing lines and help you stay focused if your lap times start to increase.

The menu used by the Alfano is very user friendly.

The main principle is with the **Left Button**; you **scroll** from one menu to the next, and then use the **right button** to make your **selection**.

To turn the unit on:

Press **both buttons** simultaneously and hold for 3 seconds then let go (the screen will then display the "**STOP**" icon, and the unit is ready to go).

To start recording lap times:

When you leave the pits in "**STOP mode**", the lap timer starts automatically to record your lap time. While on track it will continue to update your lap times and each time that you set a faster lap time it will update that field as well.

To review your lap times:

Once you arrive in the pits press the **left button** and return to "**STOP mode**";

In "**STOP mode**"; press the **right button** one time to "**RECALL**" and then you can review each lap with the **right button** again.

How to RESET and clear up memory in the unit

In "**STOP mode**"; press the **left button twice** (screen now say "**RESET**") and then press the **right button** once. Then press the **left button** twice again to get back to "**STOP mode**" and the unit is ready to go again.

How to turn off the unit:

Do not touch any buttons, wait 10 minutes, without any activity and the unit will turn off automatically.
